

12-BIT, 4 ANALOG INPUT, 6 MSPS, SIMULTANEOUS SAMPLINGANA-LOG-TO-DIGITAL CONVERTERS

FEATURES

- High-Speed 6 MSPS ADC
- 4 Analog Inputs
- Simultaneous Sampling of 4 Single-Ended Signals or 2 Differential Signals or Combination of Both
- Differential Nonlinearity Error: ±1 LSB
- Integral Nonlinearity Error: ±1.5 LSB
- Signal-to-Noise and Distortion Ratio: 68 dB at f₁ = 2 MHz
- Auto-Scan Mode for 2, 3, or 4 Inputs
- 3-V or 5-V Digital Interface Compatible
- Low Power: 216 mW Max
- 5-V Analog Single Supply Operation
- Internal Voltage References . . . 50 PPM/°C and ±5% Accuracy
- Glueless DSP Interface
- Parallel µC/DSP Interface
- Integrated FIFO
- Available in TSSOP Package
- Pin Compatible Upgrade to THS10064

APPLICATIONS

- Radar Applications
- Communications
- Control Applications
- High-Speed DSP Front-End
- Automotive Applications

DESCRIPTION

The THS1206 is a CMOS, low-power, 12-bit, 6 MSPS analog-to-digital converter (ADC). The speed, resolution, bandwidth, and single-supply operation are suited for applications in radar, imaging, high-speed acquisition, and communications. A multistage pipelined architecture with output error correction logic provides for no missing codes over the full operating temperature range. Internal control registers are used to program the ADC into the desired mode. The THS1206 consists of four analog inputs, which are sampled simultaneously. These inputs can be selected individually and configured to single-ended or differential inputs. An integrated 16 word deep FIFO allows the storage of data in order to take the load off of the processor connected to the ADC. Internal reference voltages for the ADC (1.5 V and 3.5 V) are provided.

An external reference can also be chosen to suit the dc accuracy and temperature drift requirements of the application. Two different conversion modes can be selected. In single conversion mode, a single and simultaneous conversion of up to four inputs can be initiated by using the single conversion start signal (CONVST). The conversion clock in single conversion mode is generated internally using a clock oscillator circuit. In continuous conversion mode, an external clock signal is applied to the CONV_CLK input of the THS1206. The internal clock oscillator is switched off in continuous conversion mode.

The THS1206C is characterized for operation from 0°C to 70°C while the THS1206I is characterized for operation from -40°C to 85°C. The THS1206Q is characterized to meet the rigorous requirements of the automotive environment from -40°C to 125°C. The THS1206M is characterized for operation over the full military temperature range of -55°C to 125°C.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

THS1206

(1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

TERMINAL			DECODIDEICU
NAME	NO.	1/0	DESCRIPTION
AINP	32	I	Analog input, single-ended or positive input of differential channel A
AINM	31	I	Analog input, single-ended or negative input of differential channel A
BINP	30	I	Analog input, single-ended or positive input of differential channel B
BINM	29	I	Analog input, single-ended or negative input of differential channel B
AV _{DD}	23	I	Analog supply voltage
AGND	24	I	Analog ground
BVDD	7	I	Digital supply voltage for buffer
BGND	8	I	Digital ground for buffer
CONV_CLK (CONVST)	15	I	Digital input. This input is used to apply an external conversion clock in continuous conversion mode. In single conversion mode, this input functions as the conversion start (CONVST) input. A high to low transition on this input holds simultaneously the selected analog input channels and initiates a single conversion of all selected analog inputs.
CS0	22	I	Chip select input (active low)
CS1	21	I	Chip select input (active high)
DATA_AV	16	0	Data available signal, which can be used to generate an interrupt for processors and as a level information of the internal FIFO. This signal can be configured to be active low or high and can be configured as a static level or pulse output. See Table 14.
DGND	17	I	Digital ground. Ground reference for digital circuitry.
DV _{DD}	18	I	Digital supply voltage
D0 – D9	1–6, 9–12	I/O/Z	Digital input, output; D0 = LSB
D10/RA0	13	I/O/Z	Digital input, output. The data line D10 is also used as an address line (RA0) for the control register. This is required for writing to the control register 0 and control register 1. See Table 8.
D11/RA1	14	I/O/Z	Digital input, output (D11 = MSB). The data line D11 is also used as an address line (RA1) for the control register. This is required for writing to control register 0 and control register 1. See Table 8.
REFIN	28	I	Common-mode reference input for the analog input channels. It is recommended that this pin be connected to the reference output REFOUT.
REFP	26	I	Reference input, requires a bypass capacitor of 10 μ F to AGND in order to bypass the internal reference voltage. An external reference voltage at this input can be applied. This option can be programmed through control register 0. See Table 9.
REFM	25	I	Reference input, requires a bypass capacitor of 10 μ F to AGND in order to bypass the internal reference voltage. An external reference voltage at this input can be applied. This option can be programmed through control register 0. See Table 9.
REFOUT	27	0	Analog fixed reference output voltage of 2.5 V. Sink and source capability of 250 μ A. The reference output requires a capacitor of 10 μ F to AGND for filtering and stability.
RD(1)	19	I	The RD input is used only if the WR input is configured as a write only input. In this case, it is a digital input, active low as a data read select from the processor. See timing section.
WR (R/W)(1)	20	I	This input is programmable. It functions as a read-write input R/W and can also be configured as a write-only input WR, which is active low and used as data write select from the processor. In this case, the RD input is used as a read input from the processor. See timing section.

(1) The start-conditions of \overline{RD} and \overline{WR} (R/W) are unknown. The first access to the ADC has to be a write access to initialize the ADC.

SLAS217H - MAY 1999 - REVISED JULY 2003#

FUNCTIONAL BLOCK DIAGRAM

Figure 23

15

DETAILED DESCRIPTION

Reference Voltage

The THS1206 has a built-in reference, which provides the reference voltages for the ADC. VREFP is set to 3.5 V and VREFM is set to 1.5 V. An external reference can also be used through two reference input pins, REFP and REFM, if the reference source is programmed as external. The voltage levels applied to these pins establish the upper and lower limits of the analog inputs to produce a full-scale and zero-scale reading respectively.

Analog Inputs

The THS1206 consists of 4 analog inputs, which are sampled simultaneously. These inputs can be selected individually and configured as single-ended or differential inputs. The desired analog input channel can be programmed.

Converter

The THS1206 uses a 12-bit pipelined multistaged architecture with 41-bit stages followed by 42-bit stages, which achieves a high sample rate with low power consumption. The THS1206 distributes the conversion over several smaller ADC sub-blocks, refining the conversion with progressively higher accuracy as the device passes the results from stage to stage. This distributed conversion requires a small fraction of the number of comparators used in a traditional flash ADC. A sample-and-hold amplifier (SHA) within each of the stages permits the first stage to operate on a new input sample while the second through the eighth stages operate on the seven preceding samples.

Conversion Modes

The conversion can be performed in two different conversion modes. In the single conversion mode, the conversion is initiated by an external signal (CONVST). An internal oscillator controls the conversion time. In the continuous conversion mode, an external clock signal is applied to the clock input (CONV_CLK). A new conversion is started with every falling edge of the applied clock signal.

DATA_AV

In continuous conversion mode, the first DATA_AV signal is delayed by (7+TL) cycles of CONV_CLK after a FIFO reset command. This is due to the latency of the pipe line architecture of the THS1206.

Sampling Rate

The maximum possible conversion rate per channel is dependent on the selected analog input channels. Table 1 shows the maximum conversion rate in the continuous conversion mode for different combinations.

CHANNEL CONFIGURATION	NUMBER OF CHANNELS	MAXIMUM CONVERSION RATE PER CHANNEL
1 single-ended channel	1	6 MSPS
2 single-ended channels	2	3 MSPS
3 single-ended channels	3	2 MSPS
4 single-ended channels	4	1.5 MSPS
1 differential channel	1	6 MSPS
2 differential channels	2	3 MSPS
1 single-ended and 1 differential channel	2	3 MSPS
2 single-ended and 1 differential channels	3	2 MSPS

Table 1. Maximum Conversion Rate in Continuous Conversion Mode

The maximum conversion rate in the continuous conversion mode per channel, fc, is given by:

$$fc = \frac{6 \text{ MSPS}}{\# \text{ channels}}$$

Table 2 shows the maximum conversion rate in the single conversion mode.

CHANNEL CONFIGURATION	NUMBER OF CHANNELS	MAXIMUM CONVERSION RATE PER CHANNEL
1 single-ended channel	1	3 MSPS
2 single-ended channels	2	2 MSPS
3 single-ended channels	3	1.5 MSPS
4 single-ended channels	4	1.2 MSPS
1 differential channel	1	3 MSPS
2 differential channels	2	2 MSPS
1 single-ended and 1 differential channel	2	2 MSPS
2 single-ended and 1 differential channels	3	1.5 MSPS

Tabla 2	Maximum	Conversion	Data in	Single	Conversion	Modo(1)
rable z.	waximum	Conversion	Rate in	Single	Conversion	wode

(1) Maximum conversion rate with respect to the typical internal oscillator speed (i.e.: 6 MSPS * (tc/t2).

SINGLE CONVERSION MODE

In single conversion mode, a single conversion of the selected analog input channels is performed. The single conversion mode is selected by setting bit 1 of control register 0 to 1.

A single conversion is initiated by pulsing the CONVST input. On the falling edge of CONVST, the sample and hold stages of the selected analog inputs are placed into hold simultaneously, and the conversion sequence for the selected channels is started.

The conversion clock in single conversion mode is generated internally using a clock oscillator circuit. The signal DATA_AV (data available) becomes active when the trigger level is reached and indicates that the converted sample(s) is (are) written into the FIFO and can be read out. The trigger level in the single conversion mode can be selected according to Table 13.

Figure 1 shows the timing of the single conversion mode. In this mode, up to four analog input channels can be selected to be sampled simultaneously (see Table 2).

Figure 24. Timing of Single Conversion Mode

The time (t₂) between consecutive starts of single conversions is dependent on the number of selected analog input channels. The time t_{DATA_AV} , until DATA_AV becomes active is given by: $t_{DATA_AV} = t_{pipe} + n \times t_c$. This equation is valid for a trigger level which is equivalent to the number of selected analog input channels. For all other trigger level conditions refer to the timing specifications of single conversion mode.

SLAS217H - MAY 1999 - REVISED JULY 2003#

CONTINUOUS CONVERSION MODE

The internal clock oscillator used in the single-conversion mode is switched off in continuous conversion mode. In continuous conversion mode, (bit 1 of control register 0 set to 0) the ADC operates with a free running external clock signal CONV_CLK. With every rising edge of the CONV_CLK signal a new converted value is written into the FIFO.

Figure 25 shows the timing of continuous conversion mode when one analog input channel is selected. The maximum throughput rate is 6 MSPS in this mode. The timing of the DATA_AV signal is shown here in the case of a trigger level set to 1 or 4.

Figure 26 shows the timing of continuous conversion mode when two analog input channels are selected. The maximum throughput rate per channel is 3 MSPS in this mode. The data flow in the bottom of the figure shows the order the converted data is written into the FIFO. The timing of the DATA_AV signal shown here is for a trigger level set to 2 or 4.

Figure 27 shows the timing of continuous conversion mode when three analog input channels are selected. The maximum throughput rate per channel is 2 MSPS in this mode. The data flow in the bottom of the figure shows in which order the converted data is written into the FIFO. The timing of the DATA_AV signal shown here is for a trigger level set to 3.

Figure 28 shows the timing of continuous conversion mode when four analog input channels are selected. The maximum throughput rate per channel is 1.5 MSPS in this mode. The data flow in the bottom of the figure shows in which order the converted data is written into the FIFO. The timing of the DATA_AV signal shown here is for a trigger level of 4.

Figure 28. Timing of Continuous Conversion Mode (4-channel operation)

DIGITAL OUTPUT DATA FORMAT

The digital output data format of the THS1206 can either be in binary format or in twos complement format. The following tables list the digital outputs for the analog input voltages.

Table 3. Binary Output Format for Single-Ended Configuration

SINGLE-ENDED, BINARY OUTPUT									
ANALOG INPUT VOLTAGE	DIGITAL OUTPUT CODE								
AIN = V _{REFP}	FFFh								
$AIN = (V_{REFP} + V_{REFM})/2$	800h								
AIN = V _{REFM}	000h

$V_{in} = -V_{REF}$	800h								

FIFO DESCRIPTION

In order to facilitate an efficient connection to today's processors, the THS1206 is supplied with a FIFO. This integrated FIFO enables a problem-free processing of data with today's processors. The FIFO is provided as a flexible circular buffer. The circular buffer integrated in the THS1206 can store up to 16 conversion values. Therefore, the amount of interrupts to be served by a processor can be reduced significantly.

Figure 29. Circular Buffer

The converted data of the THS1206 is automatically written into the FIFO. To control the writing and reading process, a write pointer, a read pointer and a trigger pointer are used. The read pointer always shows the location which is read next. The write pointer indicates the location which contains the last written sample. With a selection of multiple analog input channels, the converted values are written in a predefined sequence to the circular buffer (autoscan mode). In this way, the channel information for the reading processor is continually maintained.

The FIFO can be programmed through the control register of the ADC. The user has the ability to select a specific trigger level according to Table 13 in order to choose the configuration which best fits the application. The FIFO provides the signal DATA_AV, which signals the processor to read the amount of data equal to the trigger level selected in Table 13. The signal DATA_AV becomes active when the trigger condition is satisfied. The trigger condition is satisfied when as many values as selected for the trigger level are written into the FIFO.

The signal DATA_AV could be connected to an interrupt input of a processor. In every interrupt service routine call, the processor must read the amount of data equal to the trigger level from the ADC. The first data represents the first channel according to the autoscan mode, which is shown in Table 10. The channel information is therefore always maintained.

READING DATA FROM THE FIFO

The THS1206 informs the connected processor via the digital output DATA_AV (data available) that a block of conversion values are ready to be read. The block size to be read is always equal to the setting of the trigger level. The selectable trigger levels depend on the number of selected analog input channels. For example, when choosing one analog input, a trigger level of 1, 4, 8 and 14 can be selected. The following figures demonstrate the principle of reading the data.

In Figure 30, a trigger level of 1 is selected. The control signal DATA_AV is set to an active low pulse. This means that the connected processor has the task to read 1 value from the ADC after every DATA_AV low pulse.

_			\Box		\Box										\Box
DATA_AV															
READ					\square										
	Figure 32. Trigger Level 8 Selected														

In Figure 33, a trigger level of 14 is selected. The control signal DATA_AV is set to an active low pulse. This means that the connected processor has the task to read 14 values from the ADC after every DATA_AV low pulse.

CONV_CLK										
DATA_AV										
READ										
Figure 33. Trigger Level 14 Selected										

READ is always the logical combination of $\overline{CS0}$, CS1, and \overline{RD} .

ADC CONTROL REGISTER

The THS1206 contains two 10-bit wide control registers (CR0, CR1) in order to program the device into the desired mode. The bit definitions of both control registers are shown in Table 7.

REG	BIT 9	BIT 8	BIT 7	BIT 6	BIT 5 BIT 4		BIT 3	BIT 2	BIT 1	BIT 0
CR0	TEST1	TEST0	SCAN	DIFF1	DIFF0	CHSEL1	SEL1 CHSEL0 PD MODE		MODE	VREF
CR1	RBACK	OFFSET	BIN/2's	R/W	DATA_P	DATA_T	TRIG1	TRIG0	OVFL/FRST	RESET

Table 7. Bit Definitions of Control Register CR0 and CR1

Writing to Control Register 0 and Control Register 1

The 10-bit wide control register 0 and control register 1 can be programmed by addressing the desired control register and writing the register value to the ADC. The addressing is performed with the upper data bits D10 and D11, which function in this case as address lines RA0 and RA1. During this write process, the data bits D0 to D9 contain the desired control register value. Table 8 shows the addressing of each control register.

D0 – D9	D10/RA0	D11/RA1	Addressed Control Register
Desired register value	0	0	Control register 0
Desired register value	1	0	Control register 1
Desired register value	0	1	Reserved for future
Desired register value	1	1	Reserved for future

Table 8. Control Register Addressing

THS1206

SLAS217H - MAY 1999 - REVISED JULY 2003#

INITIALIZATION OF THE THS1206

The initialization of the THS1206 should be done according to the configuration flow shown in Figure 34.

Figure 34. THS1206 Configuration Flow

ADC CONTROL REGISTERS

Control Register 0 (see Table 8)

BIT 11	BIT 10	BIT 9	BIT 8	BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
0	0	TEST1	TEST0	SCAN	DIFF1	DIFF0	CHSEL1	CHSEL0	PD	MODE	VREF

Table 9. Control Register 0 Bit Functions

BITS	RESET VALUE	NAME	FUNCTION
0	0	VREF	Vref select: Bit $0 = 0 \rightarrow$ The internal reference is selected Bit $0 = 1 \rightarrow$ The external reference voltage is selected
1	0	MODE	Continuous conversion mode/single conversion mode Bit 1 = 0 \rightarrow Continuous conversion mode is selected An external clock signal is applied to the CONV_CLK input in this mode. With every falling edge of the CONV_CLK signal a new converted value is written into the FIFO.
			Bit 1 = 1 \rightarrow Single conversion mode is selected In this mode, the CONV_CLK input functions as a CONVST input. A single conversion is initiated on the THS1206 by pulsing the CONVST input. On the falling edge of CONVST, the sample and hold stages of the selected analog inputs are placed into hold simultaneously, and the conversion sequence for the selected channels is started. The signal DATA_AV (data available) becomes active when the trigger condition is satisfied.
2	0	PD	Power down. Bit $2 = 0 \rightarrow$ The ADC is active Bit $2 = 1 \rightarrow$ Power down The reading and writing to and from the digital outputs is possible during power down. It is also possible to read out the FIFO.
3, 4	0,0	CHSEL0, CHSEL1	Channel select Bit 3 and bit 4 select the analog input channel of the ADC. Refer to Table 10.
5,6	1,0	DIFF0, DIFF1	Number of differential channels Bit 5 and bit 6 contain information about the number of selected differential channels. Refer to Table 10.
7	0	SCAN	Autoscan enable Bit 7 enables or disables the autoscan function of the ADC. Refer to Table 10.
8,9	0,0	TEST0, TEST1	Test input enable Bit 8 and bit 9 control the test function of the ADC. Three different test voltages can be measured. This feedback allows the check of all hardware connections and the ADC operation. Refer to Table 11 for selection of the three different test voltages. The control signal DATA_AV is disabled in the test mode. Test voltage readings have to be done independent from DATA_AV. To get the THS1206 back to the normal operating mode, apply the the initialization routine.

ANALOG INPUT CHANNEL SELECTION

The analog input channels of the THS1206 can be selected via bits 3 to 7 of control register 0. One single channel (single-ended or differential) is selected via bit 3 and bit 4 of control register 0. Bit 5 controls the selection between single-ended and differential configuration. Bit 6 and bit 7 select the autoscan mode, if more than one input channel is selected. Table 10 shows the possible selections.

BIT 7 SCAN	BIT 6 DIFF1	BIT 5 DIFF0	BIT 4 CHSEL1	BIT 3 CHSEL0	DESCRIPTION OF THE SELECTED INPUTS
0	0	0	0	0	Analog input AINP (single ended)
0	0	0	0	1	Analog input AINM (single ended)
0	0	0	1	0	Analog input BINP (single ended)
0	0	0	1	1	Analog input BINM (single ended)
0	0	1	0	0	Differential channel (AINP-AINM)
0	0	1	0	1	Differential channel (BINP–BINM)
1	0	0	0	1	Autoscan two single ended channels: AINP, AINM, AINP,
1	0	0	1	0	Autoscan three single ended channels: AINP, AINM, BINP, AINP,
1	0	0	1	1	Autoscan four single ended channels: AINP, AINM, BINP, BINM, AINP,
1	0	1	0	1	Autoscan one differential channel and one single ended channel AINP, (BINP–BINM), AINP, (BINP–BINM),
1	0	1	1	0	Autoscan one differential channel and two single ended channel AINP, AINM, (BINP– BINM), AINP,
1	1	0	0	1	Autoscan two differential channels (AINP–AINM), (BINP–BINM), (AINP–AINM),
0	0	1	1	0	Reserved
0	0	1	1	1	Reserved
1	0	0	0	0	Reserved

1	0	1	1	1	Reserved
1	1	0	0	0	Reserved
1	1	0	1	0	Reserved
1	1	0	1	1	Reserved
1	1	1	0	0	Reserved
1	1	1	0	1	Reserved
1	1	1	1	0	Reserved
1	1	1	1	1	Reserved

Table 10	Analog	Innut	Channel	Configurations
	Analog	mput	Chaimer	configurations

Test Mode

The test mode of the ADC is selected via bit 8 and bit 9 of control register 0. The different selections are shown in Table 11.

BIT 9 TEST1	BIT 8 TEST0	OUTPUT RESULT
0	0	Normal mode
0	1	VREFP
1	0	((VREFM)+(VREFP))/2
1	1	VREFM

Table 11. Test Mode

Three different options can be selected. This feature allows support testing of hardware connections between the ADC and the processor.

Control Register 1 (see Table 8)

BIT 11	BIT 10	BIT 9	BIT 8	BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
0	1	RBACK	OFFSET	BIN/2s	R/W	DATA_P	DATA_T	TRIG1	TRIG0	OVFL/FRST	RESET

Table 12. Control Register 1 Bit Functions

BITS	RESET VALUE	NAME	FUNCTION		
0	0	RESET	Reset		
			Writing a 1 into this bit resets the device and sets the control register 0 and control register 1 to the reset values. In addition the FIFO pointer and offset register is reset. After reset, it takes 5 clock cycles until the first value is converted and written into the FIFO.		
1	0	OVFL (read only) FRST	Overflow flag (read only) Bit 1 of control register 1 indicates an overflow in the FIFO. Bit 1 = 0 \rightarrow no overflow occurred. Bit 1 = 1 \rightarrow an overflow occurred. This bit is reset to 0, after this control register is read from the processor. FRST: FIFO reset (write only)		
		(write only)	By writing a 1 into this bit, the FIFO is reset.		
2, 3	0,0	TRIG0, TRIG1	FIFO trigger level Bit 2 and bit 3 of control register 1 are used to set the trigger level for the FIFO. If the trigger level is reached, the signal DATA_AV (data available) becomes active according to the settings of DATA_T and DATA_P. This indicates to the processor that the ADC values can be read. Refer to Table 13.		
4	1	DATA_T	DATA_AV type		
			Bit 4 of control register 1 controls whether the DATA_AV signal is a pulse or static (e.g for edge or level sensitive interrupt inputs). If it is set to 0, the DATA_AV signal is static. If it is set to 1, the DATA_AV signal is a pulse. Refer to Table 14.		
5	1	DATA_P	DATA_AV polarity		
			Bit 5 of control register 1 controls the polarity of DATA_AV. If it is set to 1, DATA_AV is active high. If it is set to 0, DATA_AV is active low. Refer to Table 14.		
6	0	R/W	R/W, RD/WR selection		
			Bit 6 of control register 1 controls the function of the inputs RD and WR. When bit 6 in control register 1 is set to 1, WR becomes a R/W input and RD is disabled. From now on a read is signalled with R/W high and a write with R/W as a low signal. If bit 6 in control register 1 is set to 0, the input RD becomes a read input and the input WR becomes a write input.		
7	0	BIN/2s	Complement select		
			If bit 7 of control register 1 is set to 0, the output value of the ADC is in twos complement. If bit 7 of control register 1 is set to 1, the output value of the ADC is in binary format. Refer to Table 3 through Table 6.		
8	0	OFFSET	Offset cancellation mode Bit $8 = 0 \rightarrow$ normal conversion mode Bit $8 = 1 \rightarrow$ offset calibration mode		
			If a 1 is written into bit 8 of control register 1, the device internally sets the inputs to zero and does a conver- sion. The conversion result is stored in an offset register and subtracted from all conversions in order to reduce the offset error.		
9	0	RBACK	Debug mode Bit 9 = 0 \rightarrow normal conversion mode Bit 9 = 1 \rightarrow enable debug mode		
			When bit 9 of control register 1 is set to 1, debug mode is enabled. In this mode, the contents of control register 0 and control register 1 can be read back. The first read after bit 9 is set to 1 contains the value of control register 0. The second read after bit 9 is set to 1 contains the value of control register 1. To get the THS1206 back to the normal operating mode, apply the the initialization routine.		

FIFO TRIGGER LEVEL

Bit 2 and bit 3 (TRIG1, TRIG0) of control register 1 are used to set the trigger level of the FIFO (see Table 13). If the trigger level is reached, the DATA_AV (data available) signal becomes active according to the setting of the signal DATA_AV to indicate to the processor that the ADC values can be read.

Table 13 shows four different programmable trigger levels for each configuration. The FIFO trigger level, which can be selected, is dependent on the number of input channels. Both, a differential or a single-ended input is considered as one channel. The processor therefore always reads the data from the FIFO in the same order and is able to distinguish between the channels.

BIT 3 TRIG1	BIT 2 TRIG0	TRIGGER LEVEL FOR 1 CHANNEL (ADC values)	TRIGGER LEVEL FOR 2 CHANNELS (ADC values)	TRIGGER LEVEL FOR 3 CHANNEL (ADC values)	TRIGGER LEVEL FOR 4 CHANNELS (ADC values)
0	0	01	02	03	04
0	1	04	04	06	08
1	0	08	08	09	12
1	1	14	12	12	Reserved

Table 13. FIFO Trigger Level

TIMING AND SIGNAL DESCRIPTION OF THE THS1206

The reading from the THS1206 and writing to the THS1206 is performed by using the chip select inputs ($\overline{CS0}$, CS1), the write input \overline{WR} and the read input \overline{RD} . The write input is configurable to a combined read/write input (R/W). This is desired in cases where the connected processor consists of a combined read/write output signal (R/W). The two chip select inputs can be used to interface easily to a processor.

Reading from the THS1206 takes place by an internal \overline{RD}_{int} signal, which is generated from the logical combination of the external signals $\overline{CS0}$, CS1 and \overline{RD} (see Figure 35). This signal is then used to strobe the words out of the FIFO and to enable the output buffers. The last external signal (either $\overline{CS0}$, CS1 or \overline{RD}) to become valid will make \overline{RD}_{int} active while the write input (\overline{WR}) is inactive. The first of those external signals going to its inactive state then deactivates \overline{RD}_{int} again.

Writing to the THS1206 takes place by an internal \overline{WR}_{int} signal, which is generated from the logical combination of the external signals $\overline{CS0}$, CS1 and \overline{WR} . This signal is then used to strobe the control words into the control registers 0 and 1. The last external signal (either $\overline{CS0}$, CS1 or \overline{WR}) to become valid makes \overline{WR}_{int} active while the read input (RD) is inactive. The first of those external signals going to its inactive state then deactivates \overline{WR}_{int} again.

Figure 35. Logical Combination of CS0, CS1, RD, and WR

DATA_AV TYPE

Bit 4 and bit 5 (DATA_T, DATA_P) of control register 1 are used to program the signal DATA_AV. Bit 4 of control register 1 determines whether the DATA_AV signal is static or a pulse. Bit 5 of the control register determines the polarity of DATA_AV. This is shown in Table 14.

BIT 5 DATA_P	BIT 4 DATA_T	DATA_AV TYPE
0	0	Active low level
0	1	Active low pulse
1	0	Active high level
1	1	Active high pulse

Table 14. DATA_AV Type

The signal DATA_AV is set to active when the trigger condition is satisfied. It is set back inactive dependent of the DATA_T selection (pulse or level).

If level mode is chosen, DATA_AV is set inactive after the first of the TL (TL = trigger level) reads (with the falling edge of READ). The trigger condition is checked again after TL reads. For single conversion mode, DATA_AV type should be programmed to active level mode (set bit 4 of CR1 to zero).

If pulse mode is chosen, the signal DATA_AV is a pulse with a width of one half of a CONV_CLK cycle in continuous conversion mode. The next DATA_AV pulse (when the trigger condition is satisfied) is sent out the earliest, when the TL values, written into the FIFO before, were read out by the processor.

TIMING AND SIGNAL DESCRIPTION OF THE THS1206

Read Timing (using R/W, CS0-controlled)

Figure 36 shows the read-timing behavior when the $\overline{WR}(R/W)$ input is programmed as a combined read-write input R/W. The RD input has to be tied to high-level in this configuration. This timing is called $\overline{CS0}$ -controlled because $\overline{CS0}$ is the last external signal of $\overline{CS0}$, CS1, and R/W, which becomes valid.

Figure 36. Read Timing Diagram Using RD (CSO-controlled)

Read Timing Parameter (CS0-controlled)

	PARAMETER	MIN	TYP	MAX	UNIT
^t su(R/W)	Setup time, R/W high to last CS valid	0			ns
ta	Access time, last CS valid to data valid	0		10	ns
^t d(CSDAV)	Delay time, last CS valid to DATA_AV inactive		12		ns
th	Hold time, first CS invalid to data invalid	0		5	ns
^t h(R/W)	Hold time, first external CS invalid to R/\overline{W} change	5			ns
tw(CS)	Pulse duration, CS active	10			ns

Write Timing (using R/W, CS0-controlled)

Figure 37 shows the write-timing behavior when the $\overline{WR}(R/W)$ input is programmed as a combined read-write input R/W. The RD input has to be tied to high-level in this configuration. This timing is called $\overline{CS0}$ -controlled because $\overline{CS0}$ is the last external signal of $\overline{CS0}$, CS1, and R/W, which becomes valid.

Figure 37. Write Timing Diagram Using R/W (CS0-controlled)

Write Timing Parameter (RD-controlled)

	PARAMETER	MIN	TYP	MAX	UNIT
^t su(R/W)	Setup time, R/W stable to last CS valid	0			ns
t _{su}	Setup time, data valid to first CS invalid	5			ns
t _h	Hold time, first CS invalid to data invalid	2			ns
^t h(R/W)	Hold time, first CS invalid to R/\overline{W} change	5			ns
^t w(CS)	Pulse duration, CS active	10			ns

INTERFACING THE THS1206 TO THE TMS320C30/31/33 DSP

The following application circuit shows an interface of the THS1206 to the TMS320C30/31/33 DSPs. The read and write timings (using R/W, \overline{CSO} -controlled) shown before are valid for this specific interface.

INTERFACING THE THS1206 TO THE TMS320C54X USING I/O STROBE

The following application circuit shows an interface of the THS1206 to the TMS320C54x. The read and write timings (using R/W, CS0-controlled) shown before are valid for this specific interface.

Read Timing (using RD, RD-controlled)

Figure 38 shows the read-timing behavior when the $\overline{WR}(R/W)$ input is programmed as a write-input only. The input \overline{RD} acts as the read-input in this configuration. This timing is called \overline{RD} -controlled because \overline{RD} is the last external signal of \overline{CSO} , CS1, and \overline{RD} , which becomes valid.

Figure 38. Read Timing Diagram Using RD (RD-controlled)

Read Timing Parameter (RD-controlled)

	PARAMETER	MIN	TYP	MAX	UNIT
t _{su(CS)}	Setup time, RD low to last CS valid	0			ns
ta	Access time, last CS valid to data valid	0		10	ns
^t d(CSDAV)	Delay time, last CS valid to DATA_AV inactive		12		ns
t _h	Hold time, first CS invalid to data invalid	0		5	ns
^t h(CS)	Hold time, RD change to first CS invalid	5			ns
^t w(RD)	Pulse duration, RD active	10			ns

Write Timing (using WR, WR-controlled)

Figure 39 shows the write-timing behavior when the $\overline{WR}(R/W)$ input is programmed as a write input \overline{WR} only. The input RD acts as the read input in this configuration. This timing is called \overline{WR} -controlled because \overline{WR} is the last external signal of $\overline{CS0}$, CS1, and \overline{WR} , which becomes valid.

Figure 39. Write Timing Diagram Using WR (WR-controlled)

Write Timing Parameter	Using WR	(WR-controlled)
------------------------	----------	-----------------

	PARAMETER	MIN	TYP	MAX	UNIT
^t su(CS)	Setup time, CS stable to last WR valid	0			ns
t _{su}	Setup time, data valid to first WR invalid	5			ns
t _h	Hold time, WR invalid to data invalid	2			ns
^t h(CS)	Hold time, WR invalid to CS change	5			ns
tw(WR)	Pulse duration, WR active	10			ns

INTERFACING THE THS1206 TO THE TMS320C6201 DSP

The following application circuit shows an interface of the THS1206 to the TMS320C6201. The read (using RD, RD-controlled) and write timings (using WR, WR-controlled) shown before are valid for this specific interface.

ANALOG INPUT CONFIGURATION AND REFERENCE VOLTAGE

The THS1206 features four analog input channels. These can be configured for either single-ended or differential operation. Best performance is achieved in differential mode. Figure 40 shows a simplified model, where a single-ended configuration for channel AINP is selected. The reference voltages for the ADC itself are V_{REFP} and V_{REFM} (either internal or external reference voltage). The analog input voltage range goes from V_{REFM} to V_{REFP} . This means that V_{REFM} defines the minimum voltage, which can be applied to the ADC. V_{REFP} defines the maximum voltage, which can be applied to the ADC. The internal reference source provides the voltage V_{REFM} of 1.5 V and the voltage V_{REFP} of 3.5 V. The resulting analog input voltage swing of 2 V can be expressed by:

$$V_{\text{REFM}} \leq AINP \leq V_{\text{REFP}}$$
 (1)

VREFM

Figure 40. Single-Ended Input Stage

A differential operation is desired for many applications. Figure 41 shows a simplified model for the analog inputs AINM and AINP, which are configured for differential operation. This configuration has a few advantages, which are discussed in the following paragraphs.

Figure 41. Differential Input Stage

In comparison to the single-ended configuration it can be seen that the voltage, V_{ADC} , which is applied at the input of the ADC is the difference between the input AINP and AINM. This means that V_{REFM} defines the minimum voltage (V_{ADC}) which can be applied to the ADC. V_{REFP} defines the maximum voltage (VADC), which can be applied to the ADC. The voltage V_{ADC} can be calculated as follows:

$$V_{ADC} = ABS(AINP-AINM)$$
(2)

An advantage to single-ended operation is that the common-mode voltage

$$V_{CM} = \frac{AINM + AINP}{2}$$
(3)

can be rejected in the differential configuration, if the following condition for the analog input voltages is true:

$$AGND \le AINM, AINP \le AV_{DD}$$
 (4)

$$1 \ V \le V_{CM} \le 4 \ V \tag{5}$$

In addition to the common-mode voltage rejection, the differential operation allows a dc-offset rejection which is common to both analog inputs. See also Figure 45.

SINGLE-ENDED MODE OF OPERATION

The THS1206 can be configured for single-ended operation using dc- or ac-coupling. In either case, the input of the THS1206 must be driven from an operational amplifier that does not degrade the ADC performance. Because the THS1206 operates from a 5-V single supply, it is necessary to level-shift ground-based bipolar signals to comply with its input requirements. This can be achieved with dc- and ac-coupling. An application example is shown for dc-coupled level shifting in the following section, dc-coupling.

DC COUPLING

An operational amplifier can be configured to shift the signal level according to the analog input voltage range of the THS1206. The analog input voltage range of the THS1206 goes from 1.5 V to 3.5 V. An op-amp specified for 5-V single supply can be used as shown in Figure 42.

Figure 42 shows an application example where the analog input signal in the range from -1 V up to 1 V is shifted by an op-amp to the analog input range of the THS1206 (1.5 V to 3.5 V). The op-amp is configured as an inverting amplifier with a gain of -1. The required dc voltage of 1.25 V at the noninverting input is derived from the 2.5-V output reference REFOUT of the THS1206 by using a resistor divider. Therefore, the op-amp output voltage is centered at 2.5 V. The use of ratio matched, thin-film resistor networks minimizes gain and offset errors.

Figure 42. Level-Shift for DC-Coupled Input

DIFFERENTIAL MODE OF OPERATION

For the differential mode of operation, a conversion from single-ended to differential is required. A conversion to differential signals can be achieved by using an RF-transformer, which provides a center tap. Best performance is achieved in differential mode.

Figure 43. Transformer Coupled Input

DEFINITIONS OF SPECIFICATIONS AND TERMINOLOGY

Integral Nonlinearity

Integral nonlinearity refers to the deviation of each individual code from a line drawn from zero through full scale. The point used as zero occurs 1/2 LSB before the first code transition. The full-scale point is defined as level 1/2 LSB beyond the last code transition. The deviation is measured from the center of each particular code to the true straight line between these two points.

Differential Nonlinearity

An ideal ADC exhibits code transitions that are exactly 1 LSB apart. DNL is the deviation from this ideal value. A differential nonlinearity error of less than ±1 LSB ensures no missing codes.

Zero Offset

The major carry transition should occur when the analog input is at zero volts. Zero error is defined as the deviation of the actual transition from that point.

Gain Error

The first code transition should occur at an analog value 1/2 LSB above negative full scale. The last transition should occur at an analog value 1 1/2 LSB below the nominal full scale. Gain error is the deviation of the actual difference between first and last code transitions and the ideal difference between first and last code transitions.

Signal-to-Noise Ratio + Distortion (SINAD)

SINAD is the ratio of the rms value of the measured input signal to the rms sum of all other spectral components below the Nyquist frequency, including harmonics but excluding dc. The value for SINAD is expressed in decibels.

Effective Number of Bits (ENOB)

For a sine wave, SINAD can be expressed in terms of the number of bits. Using the following formula,

$$\mathsf{N} = \frac{(\mathsf{SINAD} - 1.76)}{6.02}$$

it is possible to get a measure of performance expressed as N, the effective number of bits. Thus, the effective number of bits for a device for sine wave inputs at a given input frequency can be calculated directly from its measured SINAD.

Total Harmonic Distortion (THD)

THD is the ratio of the rms sum of the first six harmonic components to the rms value of the measured input signal and is expressed as a percentage or in decibels.

Spurious Free Dynamic Range (SFDR)

SFDR is the difference in dB between the rms amplitude of the input signal and the peak spurious signal.

PACKAGING INFORMATION

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (CI) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <= 1000ppm threshold. Antimony trioxide based flame retardants must also meet the <= 1000ppm threshold requirement.

⁽³⁾ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

OTHER QUALIFIED VERSIONS OF THS1206 :

- Enhanced Product: THS1206-EP
- Military: THS1206M

NOTE: Qualified Version Definitions:

- Enhanced Product Supports Defense, Aerospace and Medical Applications
- Military QML certified for Military and Defense Applications

NOTES: A. All linear dimensions are in millimeters.

B. This drawing is subject to change without notice.C. Body dimensions do not include mold flash or protrusion. Mold flash and protrusion shall not exceed 0.15 per side.

🛆 Falls within JEDEC MO-153, except 30 pin body length.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (http://www.ti.com/sc/docs/stdterms.htm) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's noncompliance with the terms and provisions of this Notice.
